The PT "AQUA"

Homogeneity and stability

A screenshot of a spreadsheet used for data checking. It contains columns for 'Substrato', 'Lote', 'Data', 'Valor', 'Unidade', 'Método', 'Log10 UFC/ml', and 'Z-score'. The data is organized into rows, and there are some highlighted cells and a yellow warning box on the right side of the spreadsheet.

The data check

The statistical analysis

The comparison of results

Scheme of proficiency testing AQUA

ISO/IEC 17043:2010
Conformity assessment- **General requirements** for proficiency testing

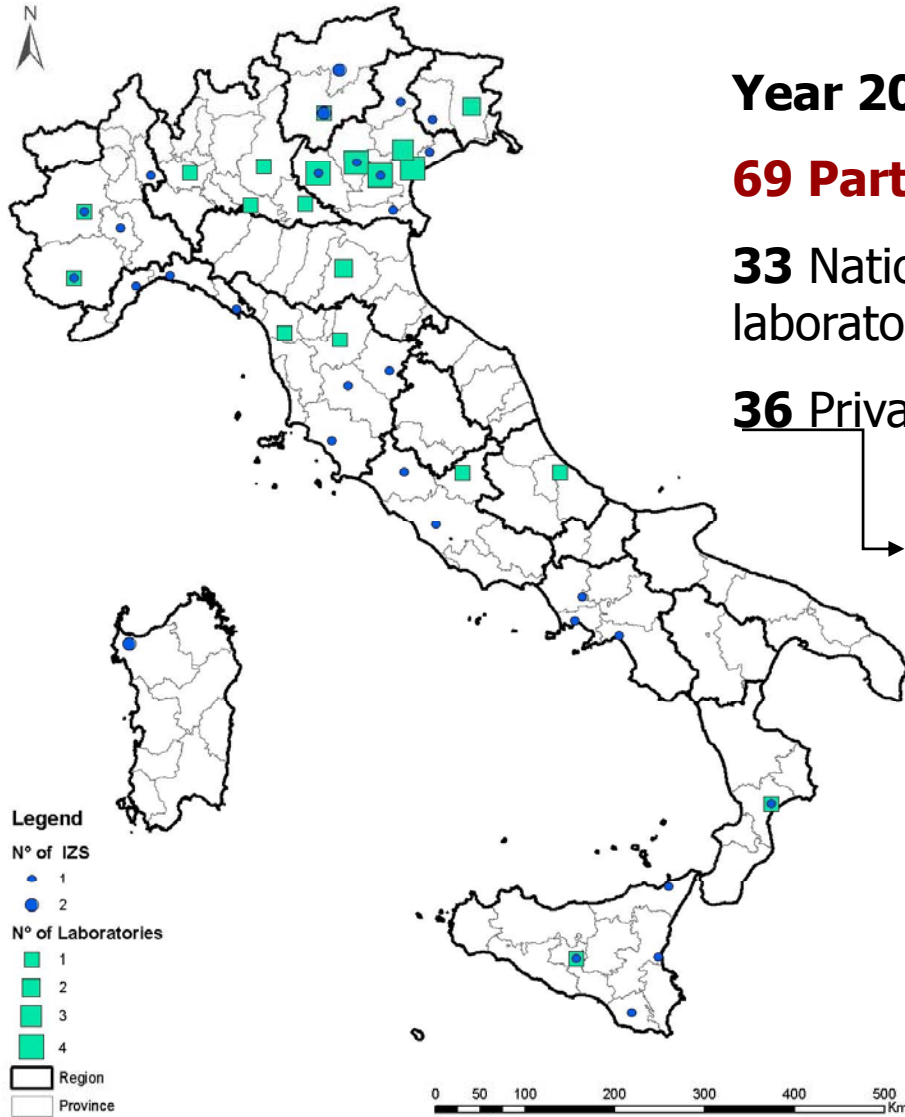

ISO/TS 22117:2010
Specific requirements for **proficiency testing** in Microbiology of food

- Diagnostic Microbiology
(Responsible dr. Michela Corrà)
- Isolation, Identification and Typing of Salmonella
(Reference laboratory for Salmonella – Responsible dr. Antonia Ricci)
- Bacteriology and virology of water organisms
(Reference laboratory for Fish health - Responsible dr. Amedeo Manfrin)
 - Parassitology shellfishes
(Reference laboratory for Fish health - Responsible dr. Giuseppe Arcangeli)
 - Virology and Serology for avian flu and Newcastle disease
(Reference laboratory for avian flu and Newcastle desesae - Responsible dr. Calogero Terregino)
- Food Microbiology
(Responsible dr. Maria Grimaldi)
- Serology and molecular biology for bovine and suine diagnostic
(Responsible dr. Stefano Nardelli)

PT in food microbiology

Year 2011

69 Participants

33 National public laboratories (IZS)

36 Private laboratories

one or more results per participant (repeatability)

Team

Proficiency testing responsible

Dr. Maria Grimaldi

Technician responsible

Dr.ssa Romina Trevisan

Statistician responsible

Dr.ssa Marzia Mancin

Proficiency testing in Food Microbiology "AQUA"

Eurachem: Istanbul, 4 October 2011

PT in food microbiology

**SHELLFISH
Matrix**

**MEAT
Matrix**

**MILK
Matrix**

PT in food microbiology

**SHELLFISH
Matrix**

Enumeration of:

Escherichia coli MPN

Detection of:

Salmonella spp.

**MEAT
Matrix**

Enumeration of:

Bacillus cereus

Detection of :

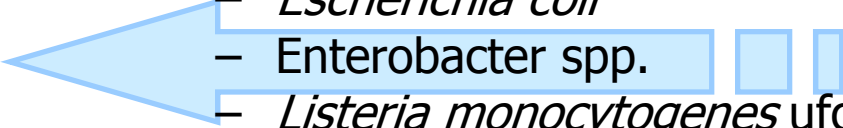

Escherichia coli O:157

PT in food microbiology

Enumeration of:

- Mesophilic bacteria
- Coagulase positive Staphylococci
- Coliform bacteria
- *Escherichia coli*
- Enterobacter spp. 
- *Listeria monocytogenes* ufc
- *Listeria monocytogenes* MPN
- Sulfite reducing *Clostridium*
- *Clostridium perfringens*
- *Campylobacter* spp.

Detection of:

- *Salmonella* spp.
- *Listeria monocytogenes*
- *Cronobacter sakazakii*
- *Campylobacter* spp.
- Staphylococcal enterotoxins

Example: *Enterobacter* spp.

- **Homogeneity**

A batch is homogeneous if each sample has the same characteristics

For counts > 40: The international harmonized protocol for the proficiency testing of analytical chemistry laboratories (IUPAC technical report, 2006)

For counts < 40: ISO/TS 22117, Annex B: T1-T2 test

- **Stability**

A batch is stable if it preserves its own microbiologic characteristics within limited values during the time of analysis (first and third day)

The international harmonized protocol for the proficiency testing of analytical chemistry laboratories (IUPAC technical report, 2006)

Observations

Scope: the batch has to be homogeneous and stable with a standard deviation target $\sigma_p=0.25$ “fitness for purpose” (from previous PT)

• **IF** the batch **is not homogeneous** for $\sigma_p=0.25$

DISCARD OF BATCH AND PRODUCTION OF A NEW BATCH

• **IF** the batch is homogeneous for $\sigma_p=0.25$
• **IF** the batch **is not stable** for $\sigma_p=0.25$

IN THE CALCULATION OF Z-SCORE THE STANDARD DEVIATION OF THE STABILITY IS TAKEN INTO ACCOUNT

Procedures of our PT

+

- INFORMATION about :
- Conservation and Treatment of samples
 - Analysis to do and suggestions about procedures and legislative requirements to follow
 - Registration of results

Routine method

Counts >10

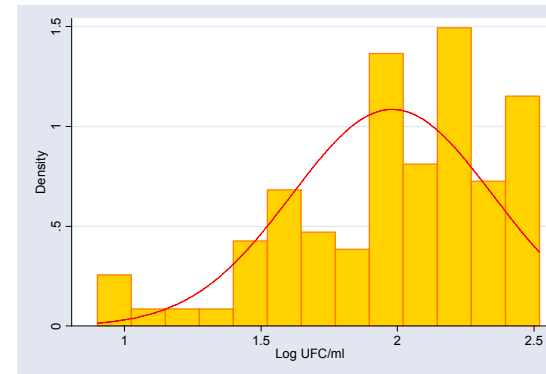

Example: *Enterobacter* spp.

- Check of data (incorrect results) and equivalence of methods 
- Z- score: provided that the data distribution is ROUGHLY symmetrical and unimodal
- Other methods according to the number of participants: 0.5log, percentile, MAD 

38 laboratories;
194 (188) observations

Example: *Enterobacter* spp.

- Descriptive statistic of data for **NOT** equivalent method

variable	N	min	max	mean	p50	sd	cv
log_data	6	9.047821	9.21034	9.174705	9.21034	.0654588	.0071347

Too few data: NO Z-score calculation for this method

- Descriptive statistic of data for equivalent methods

variable	N	min	max	mean	p50	sd	cv
log_data	188	.9	2.52	1.9805	2.04	.3676	.1856

- Z-score calculation

Example: *Enterobacter* spp.

$$Z - score = \frac{(X_i - \bar{X})}{\sigma_t}$$

X_i = observed value

\bar{X} = assigned value like **"consensus value from participants"** obtained by the algorithm A of Annex C, ISO 13528

σ_t = 0.25, **"fitness for purpose"** about the ISO 13528

-2 ≤ z-score ≤ +2	Acceptable results
-3 < z-score < -2 e 2 < z-score < 3	Questionable results
z- score ≤ -3 e z- score ≥ +3	Not acceptable results

Example: *Enterobacter* spp.

Example: *Enterobacter* spp.

■ acceptable values

■ questionable values

■ not acceptable values

Example: *Enterobacter* spp.

**THANK YOU FOR
YOUR ATTENTION**

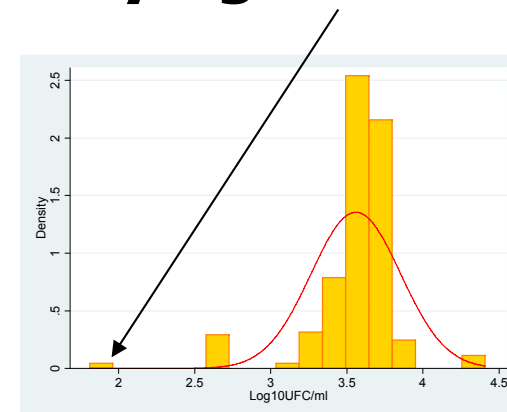

Other methods of performance evaluation

- **$\pm 0.5\log_{10}$ rule: high number of participants**

the result is good, in internal quality control procedures for microbiology laboratories, if the counts are within $\pm 0.5\log_{10}$. Statistically the 95% CIs around a mean count are generally not more $\pm 0.5\log_{10}$

- **Percentiles: ≥ 50 participants and outlying counts**

- $p_{10} < x < p_{90}$: Score 2
- $p_5 < x < p_{10}$ or $p_{90} < x < p_{95}$: Score 1
- $x < p_5$ or $x > p_{95}$: Score 0

Robust method and independent from the distribution

Other methods of performance evaluation

Median absolute deviation (MAD) from the data's median: **<50** participants and outlying counts

for new PT schemes with **<100** participants

- x within $\pm 2 \sigma_{MAD}$: Score 2
- x between $\pm 2 \sigma_{MAD}$ and $\pm 2.58 \sigma_{MAD}$: Score 1
- x outside $\pm 2.58 \sigma_{MAD}$: Score 0

$MAD = median_i(|X_i - median_j(X_j)|)$

$\sigma_{MAD} = K \cdot MAD$

if $K=1.486$ and the distribution of data is normal
 σ_{MAD} is consistent estimator for σ

Example: *Enterobacter* spp.
